It supports the AVI, MPG, MOV, MP4 and MP3 formats for the input, among others, as well as includes a video player that uses the Java applet. The interface of the program is made from a standard window with an intuitive layout, where you can load a video file into the working environment by using only the file browser, since "drag and drop" are not supported. Unfortunately, you cannot work with multiple items at the same time. Aside from previewing the clip in a built-in media player, you can select the streams after viewing the width, height, frame rate, along with the audio and video bit rate. It is also possible to trim the video by marking the start and end position, crop it, make VideoVista preserve the aspect ratio, enable deinterlacing mode, generate an HTML page, as well as include a graphics toolbar. Settings can be saved for future tasks. If you want to just play videos, then you can access a separate executable file called VideoVista Player. The straightforward application requires just a small amount of CPU and system memory, has a good response time and finishes a conversion job rapidly. We have not come across any technical difficulties during our tests since the program did not freeze, crash or pop up error dialogs. To sum it up, VideoVista is a pretty good solution for creating web-ready VVF files from common video types. However, since it works with MP4, we can work with it from the File Explorer. The application has an intuitive interface, and it has a nice user-friendly layout, without the need for a command line in any way, so you can quickly work in the program. VideoVista is compatible with multiple videos, while you can play, modify, or edit the length of the clip in real time, but the size of the resulting video file will be smaller. It has numerous additional features, like trimming, cropping, as well as a free trial period, but not from the start, we did not find any limitations in that regard. VideoVista offers the possibility to encode video files to the VVF format, while using a standard window, so you can play it online without a dedicated server. The program has an advanced video player, so you can get a preview of the file by clicking the "play" button. VideoVista also has a media player built in, so you can view the clip in a window, and you can change resolution, rotate, show the thumbnail or play it by double-clicking the file. The interface can be customized, and settings can be saved, but it is not possible to work with more than one file at a time, because the program works well with multiple streams, as well as separate the work for each one with a new window. The "player" and "view" modes are located in separate executable files. VideoVista claims to be a very fast program, so it can finish the job within a few seconds, even if you need to convert an enormous number of files, but it is possible to convert files using the "batch" mode, where it runs in the background as a service and displays a progress bar and a log. We have not come across any technical difficulties during our tests since the application has a good performance and has less than 30MB of a system memory and 4.5 MB for the CPU. VideoVista Standard Edition is a good and well-developed
